Lesson Plan – Safety in the Classroom and Safety at work

***This lesson should take place after covering rules and safety issues in the classroom.**

Objective: In this lesson, students will learn that the safety rules and issues that are learned in the classroom are the same that are applied in large manufacturing plants.

Procedure:

1. Begin the lesson by reviewing the safety rules in the classroom in discussion.
2. Present **Safety and Environmental Orientation** PowerPoint. This power point is given to all new employees at Rehau.
3. Students make list of 6 different safety issues addressed in the power point that are related to safety issues in the classroom.
4. Students break into groups to discuss a specific issue and have them present reasons the rule is important to the classroom and in the workplace. They should give examples for both places.

Evaluation:

Students will write a 1 page summary of at least 4 different safety issues in the classroom and how they are applied in the workplace.
